Area Code 217: 333-0536

July 31, 1969

To: Prospective Principal Investigators
Research Coordinators
Water Resources Center Committee Members

This booklet has been assembled to aid investigators in preparing proposals for support from the Water Resources Center and the Office of Water Resources Research. Although the quantity of funds available is modest, it is stable and should provide support for quality research by Illinois scientists well into the future.

Proposed research may be in any of the many areas related to water resources development, use, control, and protection. It may deal with economic, legal, recreational, engineering, biological, geographic, ecological, social, aesthetic or other aspects of water problems. There are undoubtedly many investigators whose work has not been directed primarily toward water problems, but which is, nevertheless, related to them. Proposals by such people to undertake studies which are water-oriented will be welcome.

The Center has the responsibility to encourage and coordinate water resources research on a state-wide basis. Thus, it is particularly anxious to draw on the abilities and the interest of investigators at other universities within the state.

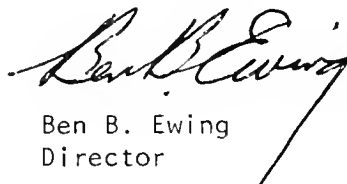

Many water resources research investigations are best conducted as a joint project by people of different scientific disciplines. Proposals for cooperative research by investigators from different departments or from different schools or scientific surveys are therefore encouraged.

I suggest that staff members who wish to submit proposals contact me as soon as possible. It will be helpful to discuss the proposed research and specific aspects of the proposal before it is submitted to the Center.

Further details on Center policies, procedures and format requirements are given in the following text. Your attention is especially directed

to the revised schedule for submission of proposals to the Center. This schedule is shown on page ix. If you have any questions concerning the Center's program I will be happy to answer them.

Sincerely,

A handwritten signature in black ink, appearing to read "Ben B. Ewing". The signature is written in a cursive style with a long, sweeping tail that extends downwards and to the right.

Ben B. Ewing
Director

GENERAL INFORMATION

CENTER BACKGROUND

The University of Illinois Water Resources Center was established as an agency of the Graduate College by the Board of Trustees in 1963. Its primary purpose was to "encourage and coordinate university-wide planning and implementation of interdisciplinary programs for research and graduate education in water resources."

Less than a year later the Water Resources Research Act of 1964 (P.L. 88-379) was passed by Congress. The act provided for the establishment of water resources research institutes in the various states in order to promote a more adequate national program of water research. The University of Illinois Water Resources Center was designated as the institute for Illinois by Governor Kerner. The designation was subsequently accepted by the University and approved by the Secretary of the Interior who administers the program on the federal level through the Office of Water Resources Research.

ANNUAL ALLOTMENT SUPPORT

To finance the programs of these state centers, the act authorized an annual allotment for each institute to plan and conduct or arrange for conduction of competent research in relation to water resources and to provide for the training of scientists. The annual allotment, which is currently \$100,000, is thus used to partly cover the administrative expenses in the Center and to support the Center's annual allotment research program. The program is selected by the Executive Committee of the Center and approved

by the Office of Water Resources Research.

MATCHING GRANT SUPPORT

Under Section 101, the act authorizes the appropriation of further funds for water research which are to be matched at least dollar for dollar by non-federal funds made available to the institutes. These federal funds must be used to support specific water resources research projects selected from throughout the nation on the basis of the merit of the project, the need for the knowledge it seeks, and the opportunity it provides for the training of scientists.

The currently authorized national level of federal funds for these projects is \$5,000,000 per year. Appropriations, however, have been below the authorized level; fiscal year 1969 being \$3,000,000. It is expected that appropriations for both fiscal years 1970 and 1971 will remain at this level. Illinois projects successful in this intense annual competition comprise the matching grant research program of the Center.

TITLE II SUPPORT

The above programs, which were authorized under Title I of the act are oriented primarily toward university research within each state. To allow for the encouragement of research by other organizations, Congress authorized further appropriations under Title II. These funds are awarded for support of specific water resources research projects after national competition of proposals from education institutions, private foundations or other institutions, private firms or individuals, and local, state and federal governmental agencies. Although proposals in any water research area are eligible, OWRR does establish subject area priorities for Title II support.

The fiscal year 1971 authorization for these projects is \$9,000,000. Although \$8,000,000 were authorized in the act for fiscal year 1970, only

\$2,000,000 were appropriated by Congress. OWRR selected 36 projects across the nation for this \$2,000,000 program. The competition was very keen in that 360 proposals were submitted requesting a total of \$35,000,000 in federal funds.

STATE SUPPORT

The State of Illinois has contributed very significantly in the past to the research program of the Water Resources Center in the form of foregone indirect costs and in those portions of academic year salaries which represent the principal investigators' time contributed to projects. Until the fiscal year 1968, the only direct support of the Water Resources Center made from state funds consisted of a small amount for administrative expenses. The budget for the University of Illinois for the biennium 1967-1969 included a line item for new program development which was to be used by the Center to provide matching funds for federal matching grant projects and to support other worthwhile water resources research. The current level of the line item is \$75,000 per year.

The majority of state funds is used to provide assurance of non-federal funds in proposals submitted for matching support and this is the priority use for them. Sometimes projects may be supported entirely from state funds, however.

RESEARCH EMPHASIS

The Executive Committee of the Center has designated three broad areas of research which can be used to classify the research program. These are (1) fundamental hydrology including hydrogeology, (2) water quality and pollution and the mechanics of pollution transport and dispersion, and (3) fundamental research in planning for water resources management including economic, legal, geographic, recreational and social aspects. The Executive Committee attempts to maintain a desirable balance between these three areas.

The members currently feel that the highest priority should be placed on the area of water resources planning. Especially important in this field is further research on (1) economic and social aspects of water resource development, use, control and protection, (2) application of modern scientific planning techniques to water resources planning, especially emphasizing the consideration of a large number of alternatives and the development of plans which provide diversity and choice to future users and decision-makers, and (3) institutional arrangements for water resources management.

It is the Executive Committee's feeling that second priority should currently be given to the area of water quality and pollution control. Especially important is further research on (1) aquatic biology and ecology, (2) sources and fates of pollution in surface and ground waters, (3) effects of pollution on the environment and on beneficial uses of water, and (4) means of controlling pollution both through advanced waste treatment and through organized enforcement.

Further study of the hydrologic system is also vital to a well-rounded approach to water resources management. It is felt, however, that except in the area of urban hydrology, this is not in such desperate need of further research as are the other areas mentioned above.

SELECTION CRITERIA

The first desire of the Executive Committee is to have the Center support high quality research. Each proposal is closely reviewed with regard to (1) the merit of the project, (2) the qualifications of the principal investigator, (3) the potential contribution to graduate education in the water resources field, (4) the project's importance to the proper management of water resources in the State of Illinois and in the nation, and (5) the compatibility of the research with the above outlined areas of emphasis.

After this appraisal, special consideration is given to projects which involve new people in research pertinent to water resources. This consideration is extended both to young investigators who have not previously developed a research reputation and to investigators who have demonstrated research capabilities, but who have not heretofore worked on water-related problems in their fields of specialization. Special consideration is also given to distribution of projects among various Illinois colleges or universities. Projects which are interdisciplinary in nature and which would result in the development of a new spirit of cooperation between investigators from diverse fields are also encouraged.

Further details concerning the preparation of each type of proposal are given in the following sections. If consideration of a proposal in more than one Center program is desired, a separate proposal must be submitted for each type of support.

ANNUAL ALLOTMENT PROPOSALS

ANNUAL ALLOTMENT SPECIAL CRITERIA

Because of the limited funds available in the annual allotment, the Executive Committee feels that the Center's annual allotment research program is most appropriately used to support as many meritorious projects as possible which also contribute to the secondary goals of the Center. For this reason projects most frequently selected are one year in duration and have a budget between four and seven thousand dollars. This money is all used for direct costs of research. The projects usually contribute significantly to graduate education, often by supporting a doctoral candidate's dissertation research. The program is also used extensively to draw on the interest of new investigators, new departments and new universities.

Some projects which are selected for support do have durations of two or three years or annual budgets as high as ten thousand dollars. The Executive Committee is hesitant, however, to commit more than a small portion of future allotments or to use sizable portions of the allotment in support of only a few projects.

Although the Center encourages interdisciplinary projects, budgetary restrictions usually preclude their inclusion in the annual allotment research program.

Prospective investigators are encouraged to contact the Director of the Center as early as possible concerning proposal preparation. He will be happy to give his reaction to your idea, discuss probable budget limitations, and give you the advantage of his insight regarding which

aspects of the proposed research will receive the most favorable reactions from the Executive Committee and from OWRR. The Center's telephone number is Area Code 217: 333-0536.

ANNUAL ALLOTMENT TIME TABLE

1. The Director of the Water Resources Center would like to be notified of interest in submitting an allotment proposal by Friday, January 9, 1970
2. Deadline for delivery of completed proposal to the Center Tuesday, February 10, 1970
3. Deadline for submission of allotment request to OWRR Wednesday, April 1, 1970
4. Expected date for OWRR notification of approval or disapproval Friday, May 1, 1970

ANNUAL ALLOTMENT PROPOSAL STYLE

Much effort can be conserved by using a format and typing style that allows approved proposals to be incorporated directly into the Water Resources Center's annual allotment request to OWRR without retyping. Hence, uniform adherence to the following style will be appreciated.

1. Type: IBM twelve point Artisan type is preferred. If this is unavailable, any clear, block-style, elite type is acceptable.
2. Spacing: The proposal is to be double-spaced except as noted below.
3. Capitalization:
 - a. Project Title: ALL CAPS
 - b. Principal Investigator(s): Last name(s) -- ALL CAPS
 - c. Project to be Conducted at: Name of institution -- ALL CAPS
4. Headings: The paragraph headings used should be those given below in the format. They are to be left justified, and underscored with the first letter of principal words capitalized.

5. Indenting: The first word in a paragraph should be indented 10 spaces.
6. Page Numbers: Numbers should appear centered at the bottom of each page.
7. Margins: Left margin - 1 1/4 in.; right, top and bottom margins - 1 in.

ANNUAL ALLOTMENT FORMAT

Each annual allotment proposal should be presented in the format explained below and shown by example on page 58. Please note the double spacing before each heading in the preliminary information and the triple spacing before each paragraph heading beginning with "Objective(s)."

Project Title: The project title must be concise and descriptive of project content. It also should show some obvious relationship to water or a water resources problem. If the proposed research is an extension of a project previously supported by OWRR and the same title is still applicable, the term "Phase II" should be added and consistently used when referring to the new project. (Completely capitalize the project title.)

FCST Research Category: See page 44 to select the Roman numeral and letter which represent the category most closely containing the proposed research.

Project to be Conducted at: Name, address and zip code of institution
(Completely capitalize the name.)

Scheduled Beginning: Month Year (This span should allow time for data analysis and for composition of

Scheduled Completion: Month Year the project completion report.)

Principal Investigator(s): Name, Title, Department (Completely capitalize last name(s) of the principal investigator(s).)

Other Professional Personnel: Name, Title, Department

Graduate Research Assistant(s): Name, seeking the (degree) degree in (major-field), or the number in each major field to be assigned later, or "None" if none are to participate.

Objective(s):

A concise statement of the specific project objectives must be given. The statement should not generally exceed half of a page.

Background:

This is an optional section in which it is anticipated many investigators will want to set the stage for discussion of procedure.

Scope:

This section is also optional. It is anticipated, however, that many investigators will want to define the scope of the research before outlining the procedure.

Procedure:

A concise statement of the principal steps to be followed in attaining each research objective must be given in this section.

Discussion:

Further information may be given in this optional section as is necessary for full understanding of the proposed project. This might include explanation of pertinent theories or empirical evidence and their relationship to the proposal research. Any other information which is considered by the investigator to be essential in review of the proposal and which is not appropriate under other headings should be included here. Investigators are asked to take special care to avoid jargon which is specific to their field so that people who are familiar with water

Problems, but who are unfamiliar with the particular research topic will be able to understand the proposal.

Relation to Other Research:

The relationship of the proposed project to completed or ongoing research by the proposed investigator or others must be given in this section. If the proposal is an extension of research previously supported by OWRR or the Center, the project should be referenced by project number and title.

The Science Information Exchange is recommended as a source of information concerning ongoing research. You may avail yourself of this service by consulting the latest volume of the *Water Resources Research Catalog* which is available through the Water Resources Center, all current principal investigators and many campus libraries.

The proposal should show in this section how the project is expected to fill gaps in the current collection of knowledge and research relative to the subject, and how it will be coordinated with ongoing research at the investigator's institution and elsewhere. Every effort should be made to avoid duplication of any existing knowledge or ongoing research.

Relation to Water Resources Problems:

The importance of this section cannot be over-emphasized. Congress is constantly asking OWRR for evidence that its sponsored research is making contributions to the solution of water resources problems such as those

listed in the FCST *Ten-Year Program of Federal Water Resources Research*. Any investigator seriously hoping for proposal support must show at least some potential way in which his research might be practically applied to a current water problem in the nation or in Illinois.

References:

List references in the order of appearance within the text of the proposal. Number them and refer to them from the text by use of superscript numerals. Individual references should be single-spaced with double-spacing between items. The reference section should not ordinarily exceed one page (approximately 15 items) in volume.

NOTE: The proposal length to this point should be about eight (8) pages

Project Personnel Qualifications:

For each member of the professional staff, excluding student assistants, give biographical data, education, professional experience, societies, honors and awards, and recent significant publications. Any standard vita format is acceptable for this purpose. Individual's qualifications should not exceed one single-spaced page.

Budget:

Complete one copy of forms A-1 and A-1a (non-federal) for each year, and form A-1b (quarterly) for the first fiscal year of the project operation. Also complete form A-1 showing amounts for the total duration of the project. Examples of the forms are found on pages 59 through 61.

Blank budget sheets are available from the Water Resources Center.

NRP Form:

Supply the requested information on the NRP form in accordance with the instructions presented on pages 52 through 56. The keywords should preferably be chosen from those included as descriptors in the *Water Resources Thesaurus*. This publication is available at the Water Resources Center.

Letter of Transmittal:

Each proposal should be covered by a dated letter or transmittal signed by the principal investigator(s) and containing the approval of the appropriate department head(s) or other authorities.

Proposal Submission:

Submit one (1) copy (the original) of the complete proposal, typed clearly on bond paper, no later than Tuesday, February 10, 1970 to the

WATER RESOURCES CENTER
2535 Hydrosystems Laboratory
University of Illinois
Urbana, Illinois 61801

MATCHING GRANT PROPOSALS

MATCHING GRANT SPECIAL CRITERIA

The Executive Committee feels that the matching grant research program should most appropriately support well-conceived, high-quality research projects which are highly relevant to water resources management in the nation and in Illinois. Thus, the decision on whether to approve the submission of a proposal to OWRR is made almost entirely on the basis of proposal merit, qualifications of the investigator, and compatibility of the project with the previously discussed areas of emphasis.

Most matching grant projects are two or three years in duration and have total federal budgets of between fifteen and forty thousand dollars. Non-federal contributions must exceed the federal portion. The Center may consider the allocation of a portion of its state funds to satisfy part of the matching requirements.

It is generally found that interdisciplinary proposals are appropriate for submission to OWRR as part of the Center's proposed matching grant research program.

OWRR has indicated that it will continue its past practice of awarding matching grants to meritorious projects which pertain to the most neglected areas of water resources research or which are responsive to areal or regional problems of critical importance. The OWRR opinion of which research areas are neglected is well-represented by the Federal Council for Science and Technology publication *A Ten-Year Program of Federal Water Resources Research* and also by the priorities given for

Title II research on page 27. The Executive Committee does not currently feel that there are significant differences between state and national research needs.

Prospective investigators are encouraged to contact the Director of the Center as early as possible concerning proposal preparation. He will be happy to give his reaction to your idea, discuss probable budget limitations and give you the advantage of his insight on which aspects of the proposed research will receive the most favorable reactions from the Executive Committee and from OWRR. This is especially important if you will need Water Resources Center state funds in order to satisfy the matching requirement. The Center's telephone number is Area Code 217: 333-0536.

MATCHING GRANT TIME TABLE

1. The Director of the Water Resources Center would like to be notified of interest in submitting a matching grant proposal by Wednesday, October 1, 1969
2. Deadline for delivery of completed proposal to the Center Friday, October 17, 1969
3. Deadline for submission of matching grant proposals to OWRR Monday, December 1, 1969
4. Expected Date of OWRR notification of approval of disapproval Sunday, March 1, 1970

MATCHING GRANT FORMAT

Each matching grant proposal must be covered by a title page of the format shown on page 64. Please note the double spacing before each heading. It should include the information explained on the next page.

REQUEST FOR MATCHING GRANT SUPPORT

To: OFFICE OF WATER RESOURCES RESEARCH, U.S. Department of the Interior,
Washington, D.C. 20240

From: WATER RESOURCES CENTER, University of Illinois, Urbana, Illinois 61801

Project Title: The project title must be concise and descriptive of project content. It also should show some obvious relationship to water or a water resources problem. If the proposed research is an extension of a project previously supported by OWRR and the same title is still applicable, the term "Phase II" should be added and consistently used when referring to the new project. (Completely capitalize the project title.)

FCST Research Category: See page 44 to select the Roman numeral and letter which represent the category most closely containing the proposed research.

Project to be Conducted at: Name, address and zip code of institution
(Completely capitalize the name.)

Scheduled Beginning: Month Year (This span should allow time for data analysis and for composition of

Scheduled Completion: Month Year the project completion report.)

Principal Investigator(s): Name, Title, Department (Completely capitalize the last name(s) of the principal investigator(s).)

This Request is Approved by: Signature space should be provided for the Principal Investigator(s), their Department Head(s), the Director of the Center, the Graduate College of the U of I in Urbana, the Business Office of the U of I in Urbana, and any other appropriate authorities. An example of a possible layout is given on page 64.

The proposal itself should be presented in the format described on the next page. Please note the triple spacing before each paragraph heading.

1. Project Description:

Objective(s): A concise statement of the specific project objectives must be given.

Background: This is an optional section in which it is anticipated many investigators will want to set the stage for discussion of procedure.

Scope: This section is also optional. It is anticipated, however, that many investigators will want to define the scope of the research before outlining the procedure.

Procedure: A concise statement of the principal steps to be followed in attaining each research objective must be given in this section.

Discussion: Further information may be given in this optional section as is necessary for full understanding of the proposed project. This might include explanation of pertinent theories or empirical evidence and their relationship to the proposal research. Any other information which is considered by the investigator to be essential in review of the proposal and which is not appropriate under other headings should be included here. Investigators are asked to take special care to avoid jargon which is specific to their field so that people who are familiar with water problems, but who are unfamiliar with the particular research topic will be able to understand the proposal.

References: List references in the order of appearance within the

text of the proposal. Number them and refer to them from the text by use of superscript numerals. Individual references should be single-spaced with double-spacing between items. They should not usually exceed one page (approximately 15 items) in volume.

2. Qualifications of Principal Investigator(s):

For each individual give biographical data, education, professional experience, societies, honors and awards, and recent significant publications. Any standard vita format is acceptable for this purpose. Qualifications should not exceed one single-spaced page for each individual.

3. Qualifications of Other Professional Staff:

Show similar evidence of qualifications for each other professional staff member in this section. It is not necessary to include student assistants. If appropriate indicate that "No other professional personnel will be involved with the project."

4. Relation to Water Resources Problems:

The importance of this section cannot be over-emphasized. Congress is constantly asking OWRR for evidence that its sponsored research is making contributions to the solution of water resources problems such as those listed in the FSCT *Ten-Year Program of Federal Water Resources Research*. Any investigator seriously hoping for proposal support must show at least some potential way in which his research might be practically applied to a current water problem of the nation or of Illinois.

5. Relation to Institute Program:

The University of Illinois Water Resources Center attempts to encourage research in three principal areas at the present time. These areas have been selected by the Executive Committee, and staff members associated with the Center are encouraged to develop specific research programs in one of these three areas. These are listed on pages 3 and 4. The proposal should discuss the relation of the proposed project to one of these areas of research. The Director of the Center will be happy to discuss this aspect with anyone who is preparing a proposal.

6. Relation to Other Research:

The relationship of the proposed project to completed or ongoing research by the proposed investigator or others must be given in this section. If the proposal is an extension of research previously supported by OWRR or the Center, the earlier project should be referenced by project number and title.

The Science Information Exchange (SIE) is recommended as a source of information concerning ongoing research. You may avail yourself of this service either by consulting the latest volume of the *Water Resources Research Catalog* or by submitting a completed NRP form to SIE for a files search. The catalog is available through the Water Resources Center, all current principal investigators and many campus libraries. There is now a charge for SIE files searches, and thus they are by no means mandatory.

The proposal should show in this section how the project is

expected to fill gaps in the current collection of knowledge and research relative to the subject, and how it will be coordinated with ongoing research at the investigator's institution and elsewhere. Every effort should be made to avoid duplication of any existing knowledge or ongoing research.

7. Training Opportunity Provided:

One important criterion in the selection of matching grant projects is the potential of the proposed research to provide for the education of water scientists. Accordingly, numbers of graduate and undergraduate students to participate in the research should be indicated.

8. Budget:

Complete one copy of form B-1 for each fiscal year of project operation and one copy of form B-2 showing amounts for the total duration of the project. Examples of the forms are shown on pages 65 and 66. Blank budget sheets are available in the Water Resources Center.

Information pertaining to some special budgetary requirements which apply to computation of indirect costs and non-federal contribution to the research may be obtained from the Water Resources Center.

9. Facilities:

Describe the major facilities to be used in the research pointing out special items which would make your department especially suitable for conduction of the proposed research.

10. Publication:

A project completion report is required. The Water Resources Center has established a series for publication of all research results. It also encourages publication in the technical scientific or scholarly literature. Therefore, please insert a statement to the effect that a completion report will be submitted and also give your intentions regarding other publications.

11. Need for Grant:

The Office of Water Resources Research requires that evidence be given that the project could not be undertaken without the grant.

12. Submission of Previous Reports:

Insert a statement to the effect that "All reports required from the Water Resources Center under Part 506 of the "Rules and Regulations" have been submitted."

13. Cooperation with Other Universities:

In the case of projects proposed by investigators in departments at the University of Illinois at Urbana-Champaign, a statement should be included to the effect that, "It is not expected that other universities in Illinois will be associated with the proposed project. The project will be carried out under the direction of the principal investigator and the graduate students employed by the project will be graduate students from the University of Illinois."

In the case of projects proposed by other universities in Illinois, which only involve personnel at that university, a statement should be included to the effect that, "The project will be carried out at _____ University at _____, Illinois under the direction of the principal investigator and the graduate students employed on the project will be graduate students at _____ University. The Water Resources Center of the University of Illinois at Urbana-Champaign agrees to assume administrative responsibility for the project and a memorandum of understanding will be executed between the University of Illinois at Urbana-Champaign and _____ University for the project in accordance with the provisions of the proposal."

If the project will involve more than one university in the execution of the research, the nature of this cooperation should also be fully explained.

14. Availability of Matching Funds:

Assurance must be given that the required matching funds are available.

15. Other Submissions:

Submission of the proposal to other funding agencies is not discouraged and does not bias its consideration under the matching grant program. Please list other agencies to which the proposal has been submitted or will be submitted, however, together with the status of each submission

if it is known. If the proposal has been turned down by an agency, the reasons and the efforts which have been made by the principal investigator to improve the proposal relative to these reasons should be given.

16. NRP Form:

Supply the required information in accordance with the directions given on pages 52 through 56. The keywords should preferably be chosen from those included in the *Water Resources Thesaurus*. This publication is available at the Water Resources Center.

Transmittal Form:

Proposals originating on the Urbana-Champaign Campus should be covered by the standard University proposal transmittal form (see example, page 78) with the signatures of the principal investigator(s), department head(s) and college dean(s).

Submission:

Submit one (1) copy (the original) of the proposal, typed clearly on bond paper, no later than Friday, October 17, 1969 to the

WATER RESOURCES CENTER
2535 Hydrosystems Laboratory
University of Illinois
Urbana, Illinois 61801

TITLE II PROPOSALS

TITLE II SPECIAL CRITERIA

It is not necessary for Title II proposals to be submitted to OWRR through the Water Resources Center unless they are being developed by a department of the University of Illinois, Urbana-Champaign Campus, or by a state scientific survey in Champaign or Urbana. Other investigators throughout the state are encouraged to submit Title II proposals through the Center or to OWRR with one copy to the Center, so that the maximum possible coordination of water research efforts in the state can be achieved. The Director of the Center will be pleased to aid in any way possible in proposal development and will forward proposals to OWRR with the strongest possible endorsement.

Information pertaining to some special budgetary requirements which apply to computation of indirect costs and non-federal contribution to the research may be obtained from the Water Resources Center.

Although any water related research subject is eligible for Title II support, OWRR has established a list of priorities for fiscal year 1971 grants. This list of priorities is reproduced on pages 27-29. Other Title II policies announced by OWRR are reproduced on pages 30-35.

It should be noted that the competition for Title II funds is extremely intense. Some statistics on the fiscal year 1970 competition are given on pages 2 and 3. Unless your proposed topic is related very closely to a priority area, it will have small probability of funding.

OFFICE OF WATER RESOURCES RESEARCH

EXAMPLES OF PRIORITY RESEARCH SUBJECTS FOR TITLE II SUPPORT

FISCAL YEAR 1971

The Office of Water Resources Research has identified the following major subject areas for primary research support in the fiscal year 1971 program. Some examples of specific research topics within these major subject areas are presented to indicate the range of problems needing research. It is not expected that a given research proposal will cover all or necessarily several of these problems. The problems are listed simply as examples of subjects to which research proposals may be related. In preparing the proposal, the principal subject or problem on which the proposed research is to focus should be identified. No significance should be attached to the order of appearance of the subject areas on the priority list.

1. Analysis of Planning, Managerial, Financial, Operating and Regulatory Policies of Water Resources Institutions. Analysis of water rights doctrines especially as they affect the process of decision making, user attitudes and water management practices and policies. Research is needed on the problems associated with multiple jurisdictions and conflicting objectives in metropolitan and regional water resources planning and management. Also, technological tools for planning water resource development on a regional or basin-wide basis may have advanced beyond our institutional capabilities for implementing the plans. While the many conflicts, discussions, and negotiations involved in finding acceptable plans are truly part of the democratic process, further understanding of the mechanisms of the process could serve to expedite the implementation phase, thus benefiting all parties concerned. Research goals should be to provide a basis for establishment of improved mechanisms including evaluation of alternative means of augmenting and conserving supply, for water resources planning, implementation of plans, and to improve management effectiveness through lessening of conflicts, uncertainties, and confusion among claimants to the resource.

2. Water Resources Policy and Political Institutions. Understanding of policy and institutional problems is indispensable to sound water resources management by both the public and private sectors of the Nation. Research is needed on how institutional policy is measured and what policies and institutional arrangements are conducive to sound water management. Among the questions to which research could be directed are those involving current policies and institutions. The river basin as a water management unit needs further evaluation with respect to the compatibility of water resources management objectives and the needs of regional economic development. How institutional arrangements affect the role of the private sector in water resources development needs to be researched. A very large segment of water resources needs are fulfilled via the activities of the private sector. Comprehensive analysis of the socio-economic water system requires understanding of how the private sector responds to alternative water management institutions. How have Federal policies and alternative state tax and regulatory

policies affected the private role in the several functional areas of water service? How have Federal and state grant programs influenced the use of private investment capital in the financing of local water development?

3. Hydrologic Systems Analysis. The application of operations research tools such as mathematical modeling and simulation, optimization and design theory need to be assessed and further explored in relation to hydrologic events and to planning of surface and ground water resources development. Research needs in the area of optimization include a better definition of benefit functions to portray the economic losses incurred during shortages in agricultural, municipal, and industrial water supplies. Rainfall-runoff models applicable to large watersheds and using both deterministic and stochastic approaches are needed. Correlation of mean annual or seasonal runoff with precipitation, evapotranspiration, physiographic and vegetal parameters would be useful in application to similar areas of sparse hydrologic data. Operations research and information theory techniques should be examined for potential application to inflow-outflow problems in hydrology, to flood routing, reservoir operation, data network design, automatic control and monitoring of water distribution systems, etc.

4. Urban and Metropolitan Water Resources Problems. Research is needed on urban hydrology and the effect of man's activities on water. Such research should include evaluation of the impact of urbanization on the frequency of flood peaks, reduction of low flows, decrease in natural ground water accretion, impairment of water quality, erosion, etc., and development of methodology and technology to cope with such problems. Knowledge of the effects of urbanization on drainage, water quality, stream regimen, water yield and flooding are essential to intelligent development and utilization of metropolitan water resources. A study of public acceptance of alternative sources of municipal water supply should be encouraged. Research is needed to define and quantify social, esthetic, and amenity benefits associated with urban waterfront development, location of and recreational use of metropolitan reservoirs, and preservation, protection, and beneficial uses of marshland and estuaries in close proximity to urban regions. Research is needed in the effects of urban encroachment on the upstream watershed, the effects of changing land use patterns, the economic consequences of the conversion of irrigated land to urban uses and the conversion of irrigation water and water rights to municipal and industrial use. Innovative approaches to water-related recreation and open space in the urban environment are needed. Research is needed on methods to reduce the cost of providing water and sewerage service to new housing. The use of "withdrawals" as a measure of water demand can be misleading when the demand-supply balance in water management and planning becomes critical. A new, rigorous definition of "water requirements" (residential, industrial, commercial and public uses) is needed which will take into account the factors of usage, withdrawal, consumption, recycle, returns and dilution.

5. Environmental Considerations in Water Resources Planning and Management. Increased knowledge of ecological processes and principles and intelligent use of ecological information can result in more enlightened resource planning and management and help maintain or improve the quality of the environment for man's well-being. Planning and management methodologies need

to be developed in the context of sound ecology in which man is regarded realistically as part of the ecosystem. The methodologies would provide for use of water and related resources with minimum degradation of the environment or, preferably, improvement of the environment.

Questions will continue to arise regarding the feasibility and capability of restoring degraded environments to a more natural and more balanced state. Of what value is a relatively unpolluted, naturalistic aquatic area in comparison with one which has been enriched by man and used extensively for mass recreation or other purposes? What are the long-term ecologic implications of man's use of an area? What criteria can be used to judge the extent to which an area can be altered without unplanned irreversible changes made in the ecology, such as loss of a rare species of fish?

Research is needed to identify and determine the ecological processes, types, and functioning of aquatic ecosystems with which man can live most harmoniously and to develop means for predicting the ecologic impacts of water development. Special consideration will be given to innovative, but positive and rational approaches to solving current problems or avoiding future water problems involving the quality of the environment, whether stemming from waste disposal, dredging, filling, drainage, irrigation, or other water development activities. One approach might be development of ecosystem analysis to a point permitting incorporation of ecological information into engineering-economic-legal-political systems analyses. This would enable decision-makers to use ecological information in conjunction with public preferences and socio-economic, political, and legal constraints, and to decide which of several possible alternative courses of action to take.

6. Evaluation of Economic Importance of Various Uses of Water, Cost Allocation, Cost Sharing, Pricing and Repayment. Allocation of water resources to specific competing uses is made difficult because market pricing techniques customarily do not reflect certain values which are recognized by the public in the areas of recreation and conservation. Study is needed of methods allocating costs among the various functions of multiple purpose water resource projects. Research is needed to develop alternatives to market pricing for quantifying esthetic, recreation and fish and wildlife benefits. Research is needed for improving the methods used in evaluating primary and secondary benefits of municipal, industrial, and agricultural water uses. Also, research is needed to identify recipients of esthetic, amenity and recreation benefits, to establish methods for determining attitudes and public preferences with respect to competing demands on the water resource, and the ability and willingness to pay for such benefits. Currently economic analysis concentrates heavily on engineering data; no satisfactory way has been developed to introduce social, esthetic, cultural, etc., costs into the economic analysis. Research efforts directed to this problem would be beneficial to both planners and resource managers.

7. Evaluation of Social Objectives in Water Policy. Benefit-cost analysis is the principal tool for analysis of public investment programs, including watershed and water resources programs. It ranks projects and programs only in terms of economic efficiency. Research is needed to determine appropriate alternative objectives and to develop methods to evaluate the benefits in relation to costs for the different objectives, such as alleviation of poverty, improved distribution of population, environmental quality, and other social values.

UNITED STATES DEPARTMENT OF THE INTERIOR

OFFICE OF WATER RESOURCES RESEARCH

Washington, D. C. 20240

June 1969

TITLE II POLICIES

Title II Policies for Administration of the Program,
Supplemental to Statutory Authorization and Regulations

1. General

- A. Title II of the Water Resources Research Act of 1964 provides the Department of the Interior with authority to support research on water problems related to its mission. Title II provides for the support of research that will aid understanding and solution of water resources problems of public concern through application of competence in addition to that available at State water research institutes under Title I of the Act, as well as increasing the professional competence and number of scientists and engineers in technical subjects related to water resources.
- B. The Title II program, which was initiated in fiscal year 1968 and expands the field of research competence that can be brought to bear on the Nation's water problems, provides for entering into research agreements with any organization or individual having adequate training, experience and qualifications, including: private and public colleges and universities; Federal, State and Local Government agencies; private industrial, engineering, or other research organizations and individuals.
- C. The Office of Water Resources Research (OWRR) seeks to assist in the solution of the Nation's water problems and will give consideration for support to unsolicited original proposals for fundamental and practical research in water resources. Originality of ideas is a recognized need in the water resources field, and research proposals that combine imaginative approaches with scientific knowledge and sound technology are encouraged. Consideration will be given to new ideas and unconventional approaches provided they are based on rational concepts and can be scientifically appraised. Proposals may be submitted to the Director of the Office of Water Resources Research at any time.

2. Criteria for Evaluation of Title II Research Project Proposals

- A. A general guide for interpreting the statutory limitation of Title II research "to undertake research into any aspects of water problems related to the mission of the Department of the Interior" is the Department's statement to the House Interior and Insular Affairs Committee (Hearings on H.R. 3606 and S. 22 and Related Bills, February 14, 1966, page 22): "The Department of the Interior is deeply interested in all aspects of water resources. We are especially concerned with the use and control of ground water, with increasing our water supplies for all sources while at the same time conserving and developing multiple uses of existing supplies, with integrated systems of river basin and watershed development, with water in the environment of the fish and wildlife that inhabit this continent with us, and with the economic and engineering aspects of water projects of many different kinds. These problems of conserving and increasing our natural water supplies, both in quantity and quality are very pressing, and call for very large development expenditures. We cannot afford to skimp on the basic and applied research which may save literally billions of dollars in construction costs over the next decade." This statement applies through the full range from fundamental basic research to specific applied research.
- B. Both applied research looking to solution of operational problems, and fundamental research looking to knowledge of basic principles of water resources phenomena qualify for consideration.
- C. Consistent with the legislative history of the authorization, a major criterion is the extent to which Title II funding will bring to bear on important water resources problems, research competence not otherwise likely to be effectively available for the statutory purpose: "to assist in assuring the Nation at all times of a supply of water sufficient in quantity and quality to meet the requirements of its expanding population." Another major criterion is the relevance of the proposed research to important water resources problems. Relating to the subject of relevance to important water resource problems, it is suggested that you will wish to review other paragraphs of Part 2 of this "Title II Policies" statement as well as the statement setting forth "Examples of Priority Research Subjects for Title II Support," a copy of which is enclosed herewith.
- D. Close attention is given to, among other things, avoidance of replicative research, or research that should be supported

from other public or private sources. However, the timely availability of such other funding may be taken into account. To enhance the effectiveness of Federal support of water resources research, proposals received by OWRR that appear to be more suitable for support by other agencies of the Department of the Interior will be brought to their attention and the author of the proposal will be so notified.

- E. Consideration also is given to the regional, State, or local importance of problems. Research that is related to specific small localities or other limited special situations will be considered where there is a reasonable basis for expectation that the results of such research are likely to have a general application.
- F. Consideration may be given to water resources problems arising in the private sector of the economy, but the extent of potential public benefit will be significant in evaluation.
- G. The following types of projects are ordinarily not considered suitable for the use of Federal appropriations made for the Water Resources Research program: (1) equipment development projects which might be undertaken by equipment suppliers; however, the development of specialized equipment or instrumentation necessary for research may be supported in cases where the demand for such equipment is insufficient to warrant development by commercial suppliers; (2) activities that are primarily data acquisition, such as projects for measuring the yield of water from different land areas, or for inventorying water resources of a specific geographic area; however, non-duplicative data collection that is an essential part of a well-planned research effort is eligible for consideration; (3) projects that constitutes mere tabulations or analyses of data already existent without being an integral part of a research effort; (4) demonstration, as contrasted with prototype projects, and (5) proposals that are predominantly water development rather than research.
- H. Applicants for Title II support are encouraged to include in the project proposal a discussion of the relationship of the specific proposed research to the principal investigator's long-term research objectives. However, in general, individual project proposals should not ordinarily extend over more than a three-year period. Broad studies of many complex component parts preferably should be submitted as discrete project

proposal units that will produce separate technical reports suitable for publication or other general release.

- I. Project proposals will be evaluated on the basis of relevancy to water resources problems, technical merit of project design and procedures, professional competence of investigators, and adequacy of cost estimates. Limited support may be provided for research investigators who have not acquired demonstrable research experience or a record of accomplishment in the water resources field if their educational background, training, or experience indicate a potential competence to conduct productive research. Each project proposal shall include a statement of justification or relevancy to water resources problems. It should identify clearly the specific problem to be studied and include a list of objectives followed by the research procedures to be employed in attaining these objectives. Other pertinent information including expected duration of the project should be provided; when the project could be started; professional competence of the personnel to perform the research as evidenced by professional degrees and positions held and lists of major publications; evidence of familiarity with past and current research related to the project; estimated costs of the research broken down by objective classifications such as personal services, equipment, materials and supplies, travel, and other; and available backup technical support and facilities.

3. Terms and Conditions of Title II Support

- A. In accordance with the provisions of the Title II authorization, application for support of research may be made by educational institutions, private foundations or other institutions, private firms and individuals (whose training, experience, and qualifications are adequate for the conduct of water research projects), and local, State, and Federal Government agencies.
- B. Title II support of research may provide either (1) the entire cost of the proposed research, or (2) a portion of the cost of the proposed research.
- C. Research agreements may be entered into through the use of (1) grants, (2) matching grants, (3) contracts, (4) other arrangements, as applicable.
- D. Encouragement is given to participation in the costs of Title II research projects by Federal or non-Federal (including private) entities in addition to the Office of Water Resources Research. Such participation, with identification

of its source and of all of its terms and conditions, is to be fully disclosed in the research project proposal. (Note: Budget (BOB) Circular A-74 requires that institutions receiving Federal research grants must share in the research costs on more than a token basis.)

- E. The basis for the determination and allowance of research project costs will be guided by applicable Federal regulations.
- F. As provided by Part 505.5 of the Rules and Regulations (CFR Title 18 - Chapter IV) pursuant to the Act, title to property purchased with Federal funds shall pass to the vest in the Government. However, title to such property can be transferred to the grantee if the grantee is a non-profit institution of higher education or a non-profit organization whose primary purpose is to the conduct of scientific research, and if appropriate justification is submitted to OWRR by the grantee so that the Director of OWRR can determine that transfer of title to the grantee would further the objectives of the Act. Proposed use of Federal funds for acquisition of large capital items or major non-expendable equipment must be fully justified and will be subject to thorough review and scrutiny. It is expected that in most instances applicants will have adequate facilities and most, if not all, equipment required for the conduct of the proposed research, or will be prepared to acquire them with non-Federal funds. Consequently, large outlays for capital items and equipment usually will not be necessary, however, a fair use charge may be a proper project cost to be met from Federal funds.
- G. Ordinarily, research work will not be subcontracted. Any subcontract covering research effort, as opposed to purchase of articles, supplies, equipment and services which are both necessary for and merely incidental to the performance of the research work shall be fully disclosed in advance. The Director, Office of Water Resources Research, may require specific advance approval in each instance of any such subcontracting arrangement.
- H. The only provision for the use of Title II Federal funds for training of students or others is as they may be employed as assistants on water resources research projects.
- I. As provided by Section 303 of the Water Resources Research Act of 1964 (P.L. 88-379, as amended) recipients of funds

must agree to accept and comply with such provisions as may be determined by the Secretary of the Interior, ". . . to insure that all information, uses, products, processes, patents, and other developments resulting from that activity will . . . be made freely and fully available to the general public." Research results obtained through Title II support must be made available to the public, usually in the form of a published research report.

- J. All research project budgets are to be prepared on a total project cost basis, and reflect cost-sharing, where applicable.
- K. Except as provided in paragraph L. below, reimbursement of actual costs incurred will ordinarily be made on the basis of vouchers submitted to OWRR. Payment is subject to withholding of not-to-exceed a stipulated portion of the total amount of the Title II financial support until certification by the Director, OWRR, that the research project has been satisfactorily completed in accordance with the terms of the grant, contract, or other arrangement.
- L. Rules and Regulations relative to the OWRR program (CFR 18, Ch. IV) provide that, upon application, educational institutions and non-profit organizations may obtain advance payments of initial expenses when OWRR determines that such payment is necessary to facilitate the work being done pursuant to the Water Resources Research Act.
- M. The Title II water resources research program contemplates widespread dissemination of the research results. Hence, research project completion reports, required by terms of the funding agreement, are to be prepared in a form suitable for reproduction and nationwide distribution to interested persons and organizations.

TITLE II TIME TABLE

Proposals must be in the mail to OWRR and postmarked by midnight October 1, 1969. If a proposal from another university is to be submitted through the Center, a few days should be allowed for review and comment. Proposals submitted by departments at the University of Illinois, Urbana-Champaign Campus, require a similar period for review and for obtaining the necessary approvals. Proposals should therefore be received by the Center no later than Wednesday, September 24.

TITLE II FORMAT

The Office of Water Resources Research has released the following guidelines for proposal composition. Proposals submitted directly to OWRR should be in eight (8) copies. Proposals submitted through the Center by persons not associated with the Urbana-Champaign Campus of the University of Illinois should be accompanied by one extra copy (total of nine) for the Center's files. An acceptable alternative is for the eight copies to be sent directly to OWRR and for only one copy to be sent to the Center. The Director will then mail his endorsement to OWRR upon review of the proposal. Proposals from personnel associated with the University of Illinois, Urbana-Champaign Campus must be submitted through the Center and should include an additional extra copy (total of ten) for the Business Office files. These U of I proposals should also be covered with a title page allowing for required signatures (see example on page 68) and the standard university proposal transmittal form (see example, page 78).

UNITED STATES DEPARTMENT OF THE INTERIOR

OFFICE OF WATER RESOURCES RESEARCH

Washington, D. C. 20240

June, 1969

GUIDES FOR SUBMISSION OF RESEARCH PROPOSALS TO THE OFFICE
OF WATER RESOURCES RESEARCH (OWRR) PURSUANT TO TITLE II
OF THE WATER RESOURCES RESEARCH ACT OF 1964, AS AMENDED

Where to Submit. Research proposals should be addressed to the Director, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. (Telephone: AC-202--343-5975)

Number of Copies. All proposals must be submitted in 8 copies.

Proposal Content. The formal proposal is a detailed official document which must be signed by the individual or official authorized to commit the applicant. The proposal document forms the basis both for scientific evaluation and for research agreement negotiations. The proposal may be submitted in any form best suited to the specific topic but the following information must be included in the proposal:

- (a) A summary and cover sheet - see Form C-1 attached;
- (b) Narrative Information - see numbered paragraphs below;
- (c) Financial Plan Information - see Forms C-2, 3, 4, and 5 attached; and
- (d) Notice of Research Project (NRP) - see numbered paragraph 14 of Narrative Information below and related attached instructions contained in Exhibit 1 attached.

- - - - -

Water Resources Research Proposal

Narrative Information

1. Project Title: The title of the proposed research project should be brief, but properly descriptive, using keywords suitable for indexing and retrieval. The title should relate to water resources research.

2. Organization of Applicant: All applicants must furnish the following information:
 - (a) Legal name and address of applicant.
 - (b) Type or kind of applicant (e.g., academic institution, non-profit institution, corporation, partnership, individual, etc.), including, as applicable, statements as to its nature, officers, and principal business.
 - (c) Name, title, and address of the individual authorized to commit the applicant. The proposal must be signed by this individual.
 - (d) Name, title, and address of the individual accountable for receipt and disbursement of funds obtained for Title II research.
 - (e) Name, title, and address of principal investigator(s) responsible for the performance of the proposed research.
3. Evidence of Applicant's Qualifications: Except for academic institutions submitting a proposal that requests Federal funds in the amount of \$100,000 or less, applicants should furnish information relating to:
 - (a) Adequacy of the organization and financial resources for performance of the proposal;
 - (b) Experience, skills, and special qualifications held by the applicant for performance of the research project;
 - (c) Record of performance in conducting Federally-supported and other research in the past five years;
 - (d) Ability of the applicant to adhere to the proposed time schedule of performance as stated in the proposal; and
 - (e) Equipment, space, and other facilities that are available for use in the conduct and support of the proposed research.
4. Objectives of Proposed Research: There must be a statement of specific objectives showing the scientific results expected to be achieved through performance of the proposed research.
5. Research Plans: Information on research procedures must be submitted in sufficient detail so that those who perform the technical review of the proposal can appraise the adequacy of procedures and the likelihood of successful attainment of objectives. The scope and plan of the proposed research should be a definite statement of what the applicant proposes to do during the period of performance of the research project.

6. Period of Research Performance: The desired starting date (on or after July 1) and the planned completion date of the research must be shown in the proposal. Project duration shall include the time necessary for the preparation and submission to OWRR of draft copies of a project technical completion report. Research agreements may be for any period of time, but normally will not exceed 3 years in duration.
7. Relevancy of the Proposed Research to Water Resources Problems: One of the important factors that may be used by the Department of the Interior, the Office of Science and Technology, the Congress, and others in appraising the effectiveness of the Office of Water Resources Research program is the extent to which programs supported under the Water Resources Research Act of 1964 relate to important local, regional, and national water problems. Therefore, an appropriate "relevancy" statement should be included in the proposal. In this connection, it is suggested that you refer to the "TITLE II POLICIES" statement as well as the statement setting forth "Examples of Priority Research Subjects for Title II Support," both of which are enclosed herewith. Priority areas identified in those two documents, plus others that may occur to you, are suggested as a basis for identification of the problems associated with your proposed research project.

Indicate (spaces are provided on Form C-1): (a) the FCST research category number -- see "FCST Water Resources Research Categories", copy of which is attached to Exhibit 1 enclosed herewith; and (b) the OWRR priority research subject number -- see "Examples of Priority Research Subjects for Title II Support," enclosed herewith.

8. Background Information and Related Ongoing Research: The proposed research should not involve undesirable duplication of completed or ongoing research work.

The proposal document should contain: (a) concise information as to previous research related to the proposed project with citations of the technical literature on the subject; (b) citations of related ongoing research projects and a statement pointing out the relationship of the proposed research to such similar ongoing research; and (c) a statement of how the proposed project is expected to fill gaps in available knowledge on the subject.

In connection with other related ongoing research, attention of each principal investigator is called to two methods that exist to obtain information regarding related research projects in progress prior to submittal of a proposal to the Office of Water Resources Research. One method is to request the Science Information Exchange (SIE) to provide copies of Notices of Research Projects (NRP's) related to the specific subject matter of your proposal. (Note: SIE has Federal Government responsibility for cataloging information regarding water resources research projects in progress.) SIE makes a charge for providing this service. Inquiries should be directed to:

Director, Science Information Exchange
Suite 300, Madison National Bank Building
1730 M Street, N. W.
Washington, D. C. 20036

Telephone: 381-5511 - Area Code 202

A second method is to consult Volume 4 of the Water Resources Research Catalog which contains abstracts of over 4,500 ongoing research projects indexed by subject, investigator, contractor, and supporting agency. A copy of Volume 4 of the catalog may be obtained, for \$8.50, by writing to:

Superintendent of Documents
Government Printing Office
Washington, D. C. 20401

9. Qualifications of Principal Investigator(s): The number and qualifications of the personnel who will conduct the proposed research, with the name, education, experience, and accomplishments of the principal scientists must be included in the proposal.
10. Time and Effort of the Principal Investigator(s): The proposal must show:
 - (a) What other research will be conducted by the principal investigator(s) coincidentally with this proposed research; and
 - (b) What portion of the principal investigator(s) time will be devoted to this project.
11. Project Proposed Financial Plan: A time and cost estimate must be provided, similar to that shown by Forms C-2, C-3, C-4, and C-5 attached. The provisions of Federal Procurement Regulations (Part 1-15) relating to general cost principles and procedures will serve as a guide in the determination and allowance of research project costs.
12. Cost and Pricing Data: As provided by Part 1-3.807 of Federal Procurement Regulations, all applicants excepting educational institutions must furnish a Certificate of Cost and Pricing Data in connection with a proposal which exceeds \$100,000 in amount.
13. Indirect Costs and Employee Benefits: If indirect costs are included in the project financial plan, there should be a statement as to how such costs are determined. If indirect cost rates (or rate) are involved, advice should be furnished as to whether they are under audit by a Federal agency and, if so, the name and address of the agency. If employee benefits are included in the financial plan as costs, the components and method of computation should be explained.

14. Notice of Research Project (NRP): An original and three copies of an NRP are required. A separate statement provides instructions for the preparation of an NRP. (See Exhibit 1 attached)
15. Training: If the training of water resources scientists will be a by-product of research project activity, the proposal should include appropriate statements describing the extent and type of training to be provided, including the number of trainees participating.
16. Publication of Research Results: The intended method of making the research results generally available on a timely basis must be included in the proposal.
17. Non-Federal Contribution to the Research Effort: If the project proposal (financial plan) indicates that non-Federal contributions are to be applied to the accomplishment of the proposed research, written assurance must be provided that the non-Federal contributions stated in the research proposal will be forthcoming if the proposal is approved for funding by OWRR. Cost participation, with identification of its source and of all of its terms and conditions shall be fully disclosed in the research project proposal. (Note: Grants to academic institutions are subject to the provisions of Bureau of the Budget Circular A-74.)
18. Submittal of Proposal to Other Funding Sources: The proposal must state whether the project has been or will be submitted to organizations other than OWRR for the purpose of obtaining funding support, with the names of any such organizations. Similar information, with the part (or parts) of the project similarly identified, should be provided when only a part (or parts) of the project proposal has been or will be submitted to another organization.
19. Research Time Period: The proposal must show the time period during which this proposal is valid.
20. Proprietary Information: Any aspects of the proposal for which the applicant claims a proprietary interest should be clearly marked or identified. OWRR will respect such proprietary interests.

- - - - -

Terms and Conditions Desired by Applicant: The research proposal may be accompanied by the applicant's statement of the terms and conditions desired in the contract or agreement controlling the performance of the proposed research.

Notification of Selection or Non-selection: OWRR's intent is to notify proposing organizations as early as possible, perhaps about May 15, of the selection of proposals for support beginning July 1 or after of a new fiscal year. Such notification may need to be made contingent upon appropriation, by the Congress, of moneys required for support of selected projects. At the earliest feasible date, proposing organizations will also be notified of the non-selection of proposals.

APPENDIX I

Federal Council for Science and Technology Listing
of
WATER RESOURCES RESEARCH CATEGORIES

Water Resources Research Categories

I. Nature of Water

Category I deals with fundamental research on the water substance.

A. Properties of water

Study of the physical and chemical properties of pure water and its thermodynamic behavior in its various states.

B. Aqueous solutions and suspensions

Study of the effects of various solutes on the properties of water; surface interactions; colloidal suspensions.

II. Water Cycle

Category II covers generally research on the natural processes involving water. It is an essential supporting effort to applied problems in later categories.

A. General

Studies involving two or more phases of the water cycle such as hydrologic models; rainfall-runoff relations; surface and ground-water relationships; watershed studies, etc.

B. Precipitation

Investigation of spatial and temporal variations of precipitation; physiographic effects; time trends; extremes; probable maximum precipitation; structure of storms, etc.

C. Snow, ice, and frost

Studies of the occurrence and thermodynamics of water in the solid state in nature; spatial variations of snow and frost; formation of ice and frost; breakup of river and lake ice; glaciers, permafrost, etc.

D. Evaporation and transpiration

Investigation of the process of evaporation from lakes, soil, and snow and of the transpiration process in plants; methods of estimating actual evapotranspiration; energy balance; etc.

E. Streamflow

Mechanics of flow in streams; flood routing; bank storage; space and time variations (includes high- and low-flow frequency); droughts; floods; etc.

F. Ground water

Study of the mechanics of ground-water movement; multiphase systems; sources of natural recharge; mechanics of flow to wells and drains; subsidence; properties of aquifers; etc.

G. Water in soils

Infiltration, movement, and storage of water in the zone of aeration, including soil.

H. Lakes

Hydrologic, hydrochemical, and thermal regimes of lakes; water level fluctuations; currents and waves.

I. Water and plants

Role of plants in hydrologic cycle; water requirements of plants; interception.

J. Erosion and sedimentation

Studies of the erosion process; prediction of sediment yield; sedimentation in lakes and reservoirs; stream erosion; sediment transport, etc.

K. Chemical processes

Chemical interactions between water and its natural environment; chemistry of precipitation.

L. Estuarine problems

Special problems of the estuarine environment; effect of tides on flow and stage; deposition of sediment; sea water intrusion in estuaries.

III. Water Supply Augmentation and Conservation

As water use increases we must pay increasing attention to methods for augmenting and conserving available supplies. Research in category III is largely applied research devoted to this problem area.

A. Saline water conversion

Research and development related to methods of desalting sea water and brackish water.

B. Water yield improvement

Increasing streamflow or improving its distribution through land management; water harvesting from impervious areas; phreatophyte control; reservoir evaporation suppression.

C. Use of water of impaired quality

Research on methods of agricultural use of water of high salinity; use of poor quality water in industry, crop tolerance to salinity.

D. Conservation in domestic use

Methods for reducing domestic water needs without impairment of service.

E. Conservation in industry

Reduction in both consumption and diversion requirements for industry.

F. Conservation in agriculture

More efficient irrigation practices. Chemical control of evaporation and transpiration; lower water use plants; etc.

IV. Water Quantity Management and Control

Category IV includes research directed to the management of water, exclusive of conservation, and the effects of related activities on water.

A. Control of water on the land

Effects of land management on runoff; land drainage; potholes; etc.

B. Groundwater management

Artificial recharge; conjunctive operation; relation to irrigation.

C. Effects of man's related activities on water

Impact of urbanization, highways, logging, etc., on water yields and flow rates.

D. Watershed protection

Methods of controlling erosion to reduce sediment load of streams and conserve soil.

V. Water Quality Management and Protection

An increasing population increases the wastes and other pollutants entering our water supplies. Category V deals with methods of identifying, describing, and controlling this pollution.

A. Identification of pollutants

Techniques of identification of physical, chemical, and biologic pollutants; rational measures of character and strength of wastes.

B. Sources of pollution

Determination of the sources of pollutants in water; the nature of the pollution from various sources; path of pollutant from sources to stream or ground water.

C. Effects of pollution

Definition of the effect of pollutants, singly and in combination, on man, aquatic life, agriculture, and industry under conditions of sustained use; eutrophication.

D. Waste treatment processes

Research to improve conventional treatment methods to gain efficiency or reduce cost; processes to treat new types of waste; advanced treatment methods for more complete removal of pollutants including purification for direct reuse.

E. Ultimate disposal of wastes

Disposal of residual material removed from water and sewage during the treatment process; disposal of waste brines.

F. Water treatment

Development of more efficient and economical methods of making water suitable for domestic or industrial use.

G. Water quality control

Research on methods to control stream and reservoir water quality such as flow augmentation; stream and reservoir aeration; control of natural pollution; control of pollution from pesticides and agricultural chemicals; control of acid mine drainage; etc.

VI. Water Resources Planning

The problems of achieving an optimal plan of water development are becoming increasingly complex. Category VI covers research devoted to determining the best way to plan, the appropriate criteria for planning and the nature of the economic, legal and institutional aspects of the planning process.

A. Techniques of planning

Application of systems analysis to project planning; treatment of uncertainty; probability studies.

B. Evaluation process

Development of methods, concepts, and criteria for evaluating project benefits; discount rate; project life; methods for economic, social, and technological projections; reliability of projections; research on the value of water in various uses.

C. Cost allocation, cost sharing, pricing, and repayment

Research on methods of calculating repayment and establishing prices for vendible products; techniques of cost allocation; cost sharing; pricing and repayment policy.

D. Water demand

Research on the water quantity and quality requirements of various uses, both diversion and consumption.

E. Water law

A study of State and Federal water law looking to changes and additions which will encourage greater efficiency in use; investigation of institutional structures and constraints which influence decisions on water at all levels of government.

F. Nonstructural alternatives

Exploration of methods to achieve water development aims by nonstructural methods such as flood plain zoning.

G. Ecologic impact of water development

Effects of water management operations on the overall ecology of the area. Excludes effect of pollution under V.C.

VII. Resources Data

Planning and management of our water resources require information. Category VII includes research oriented to data needs and the most efficient methods of meeting these needs.

A. Network design

Studies of data requirements and of the most effective methods of collecting the data.

B. Data acquisition

Research on new and improved instruments and techniques for collection of water resources data; telemetering equipment.

C. Evaluation, processing, and publication

Studies of effective methods of processing data; form and nature of published data; maps of data.

VIII. Engineering Works

To implement water development plans requires engineering works. Category VIII describes research on design, materials, and construction which is generally useful to all aspects of water management. Works relevant to a single specific goal, such as water treatment or desalination, are included elsewhere if an appropriate category exists.

A. Design

Research leading to improved design of dams, canals, pipelines, locks, fishways, and other works required for water resource development.

B. Materials

Research to improve existing structural materials and to develop new materials; subsurface exploration of foundations; corrosion; etc.

C. Construction and operation

Research on efficient construction methods, operating systems, and maintenance procedures.

IX. Manpower, Grants and Facilities

Trained manpower is an essential ingredient of research on water resources and the planning and design of water development projects. Category IX describes plans for support of education and training. It also includes grant and contract programs for which advance distribution to specific categories is impossible.

A. Education—extramural

Support of education in water resources at universities (not including research support under other categories).

B. Education—in-house

Government employee training programs.

C. Research facilities

Laboratories, field stations, etc.

D. Grants, contracts, and research act allotments

Allotments to university water resources research institutes under Public Law 88-379; OWRR, HEW, NSF, CSRS and other grants which cannot be distributed to categories in advance.

X. Scientific and technical information

Development of adequate procedures for storing, locating, and exchanging scientific and technical information is vital to the success of a research program. Category X includes efforts directed toward the planning and performance of the functions involved in acquiring, processing, and communicating scientific and technical information. The category does not include data acquisition or the handling of unprocessed data.

A. Publication

Includes reproduction and distribution of recorded scientific and technical information.

B. Bibliographic Services

Acquisition, abstracting, translating, and other services associated with storage and retrieval of scientific information.

C. Direct Communication

Support of technical meetings, symposiums, and other forums for oral exchange of scientific information.

D. Research and Development in Information Science

Research on new methods, techniques, and systems for improving scientific and technical information services in the areas of water management and water research.

APPENDIX II

PREPARATION OF
NOTICE OF RESEARCH PROJECT

UNITED STATES DEPARTMENT OF THE INTERIOR
Office of Water Resources Research
Washington, D. C. 20240

June 1969

PROJECT PROPOSALS: PREPARATION AND PROCESSING OF
NOTICES OF RESEARCH PROJECTS (NRP'S)

- A. Each project proposal submitted to OWRR should include four clean copies of a completed Notice of Research Project (NRP) form, including a suggested FCST category and subcategory number (See attachment hereto), and suggested keywords. It should be understood that in submitting a project proposal, the researcher agrees to permit dissemination and publication of the NRP in a water resources research catalog or other document if the project is approved for support with Federal funds.
- B. The Science Information Exchange (SIE) has Federal Government responsibility for cataloging information regarding water resources research projects in progress. After a proposal has been approved for funding by OWRR (which office will notify SIE), the proposing organization or the principal project investigator may be contacted by SIE or OWRR and asked for an updated version of the Notice of Research Project (NRP) for inclusion in a catalog of water resources research. This may be necessary to ensure that such catalog reflects accurately the research underway which may have been changed from the original concept as a result of negotiations with OWRR. Requests for an updated NRP should be complied with promptly.
- C. The enclosed NRP for the Science Information Exchange asks for the six different items of information mentioned below. Each principal investigator can make a contribution to improved communications among researchers by carefully considering each of these items in preparing his NRP.

1. Supporting Agency or Who Is Paying for It

All projects submitted for support by the Office of Water Resources Research should show: Department of the Interior, Office of Water Resources Research.

2. Title

The selection of a title for a research proposal is an important responsibility of the principal investigator. A well-written title is one of the simplest and most effective devices for announcement

and retrieval of information. We suggest that it be prepared after the proposal and descriptive summary have been written.

Authors should use specific, informative words that will be helpful to a person trying to judge the content of the research from its title. Keep the title short. Avoid superfluous phrases, such as "A Study of the Factors Affecting..." Writing a short title, yet one that conveys specific information on the research, is a challenge. By eliminating all unnecessary introductory words and leaving the detail to the descriptive summary, a title of less than one hundred characters, covering not more than one typed line on the NRP, should be sufficiently informative. In many cases, a title only half that length is adequate and desirable.

3. Who

All investigators and other professional personnel responsible for the project should be listed on the Notice along with their schools, titles, department affiliations, or other organizations. The principal investigator on each project should be so identified and his complete mailing address, including zip code, should be shown on the NRP to facilitate direct communication.

4. Where

For all OWRR projects, the name of the research organization and its complete mailing address, including zip code, should be provided. In the case of Title I projects, if the project is located at an institution other than where the State institute is located, the name and complete address of such institution should be shown also.

5. Summary of Proposed Work (What, Why, and How Is It Being Done)

The summary of the project as written may appear in a water resources research catalog. Therefore, it should be as informative and specific as possible without divulging information on potential patents. It should clearly describe the problem, the objectives, the relationship of the project to aspects of broader areas of research, and how the principal investigator plans to go about conducting the research. The summary should not exceed 200 words. Immediately following the summary, the principal investigator should suggest the FCST Category and Subcategory in which his research is best placed. The latest list of categories and subcategories is attached hereto.

In addition to suggesting the FCST Categories, the principal investigator should suggest keywords that describe the subject areas of his research from several points of view; both very specific and broader

terms can be used. The most important terms should be denoted by an asterisk preceding the word (see enclosed example).

(Note: OWRR has published a "Water Resources Thesaurus - A Vocabulary for Indexing and Retrieving the Literature of Water Resources Research and Development." Keyword selection will be facilitated by referring to that document. The "Water Resources Thesaurus" is available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The price is \$2.00.)

6. Duration and Cost

The anticipated duration of the proposed project should be indicated in terms of month/year to month/year. The level of support for the period shown should be given at the bottom of the NRP. For matching grants, the Federal and non-Federal contributions should be shown separately. Each non-Federal contributor should be identified so that proper acknowledgment can be made in water resources research catalogs.

SUMMARY OF PROPOSED WORK - (200 words or less.) - In the Science Information Exchange summaries of work in progress are exchanged with government and private agencies supporting research, and are forwarded to investigators who request such information. Your summary is to be used for these purposes.

The proposed research plan involves laboratory and field investigations directed at the determination of the fate of nitrogen in subsoils as related to ground water contamination. The main approach in the investigations is to observe and to analyze the physical, chemical and microbiological actions resulting from the passage of nitrogen contaminated waters through soils under various conditions.

Laboratory investigations would employ the following methods:

1. Small scale experiments on intimately mixed contaminated waters and soils.
2. Experiments using soil columns and lysimeters under continuous and intermittent flow conditions.

Field investigations would include ground water observations obtained with the following systems:

1. Wells for injection of contaminated waters in fields of sampling wells.
2. Sampling wells in the vicinity of septic tank leaching systems and waste stabilization ponds.

Laboratory and field data would be correlated for practical application in the location of waste water systems with respect to ground water supplies.

Keywords: *Nitrogen, *Soils, *Groundwater, *Water Pollution, Waste Water Systems, Injection Wells

ANNUAL ALLOTMENT TITLE PAGE AND BUDGET FORMS

Project Title: THE IDENTIFICATION AND CRITICAL ANALYSIS OF SELECTED LITERATURE DEALING WITH THE RECREATIONAL ASPECTS OF WATER RESOURCES USE, PLANNING, AND DEVELOPMENT

FCST Research Category: 11-D

Project to be Conducted at: SOUTHERN ILLINOIS UNIVERSITY, Carbondale, Illinois 62901

Scheduled Beginning: July 1968

Scheduled Completion: June 1971

Principal Investigators: Richard H. Smyth, Professor, Recreation and Park Administration
Edward J. Jackson, Associate Professor, Agronomy

Other Professional Personnel: George R. Perish, Research Soil Scientist, Agricultural Research Service, U.S.D.A.

Graduate Research Assistants: Roger B. Dexter, seeking the Ph.D. in Recreation and Park Administration
Jack A. Roberts, seeking the Ph.D. in Recreation and Park Administration
Elizabeth S. Allen, seeking the M.S. in Recreation and Park Administration
Two (2) others in Agronomy to be assigned

Objective(s):

The research is to be aimed at development of a practical procedure by which the stochastic behavior of the hydrologic....

Background:

The principal investigators have shown previously that hydrologic phenomena are characteristically stochastic rather than deterministic or purely probabilistic....
